Down the hole transducer installation

The down the hole transducer can be installed two ways.

- 1) If recovery is wanted and the hole is shallow: Place the transducer in the hole and put in a little sand to fill up the hole. A piece of PVC marked with the geophone orientation can be used to push the transducer into the hole.
- 2) If the transducer is going to be left in a deeper hole: The best results are to use the PVC pipe mentioned above to push the transducer into the hole. Then use cement to fill the hole. For best results the cement can be pumped in to make sure it reaches the bottom. Pouring it down may let it get blocked part way down.
